

## DSPD Assignment - 2

This algorithm is used to implement 'BigInt' data type with (+, -, \*) operations that supports 1024 bits.

The code takes in input from the user and stores the input in string.

Depending on the input from user the further steps take place. If the user inputs the operation as '+', then the code will run add-help.

Whereas if the user enters input as '-', then subtract-help will run, and if the user enters '\*' multiply-help will run.
